

# Becoming an intentional agent: The emergence of voluntary action

Bernhard Hommel

Leiden University Institute for Psychological Research  
& Leiden Institute for Brain and Cognition  
The Netherlands

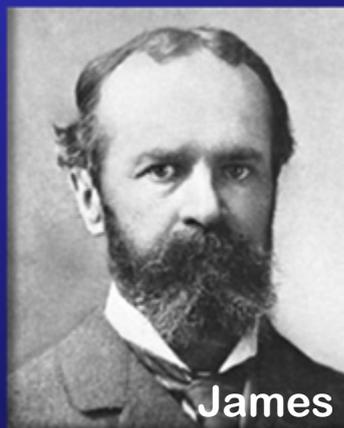

# How do you tie your shoe?

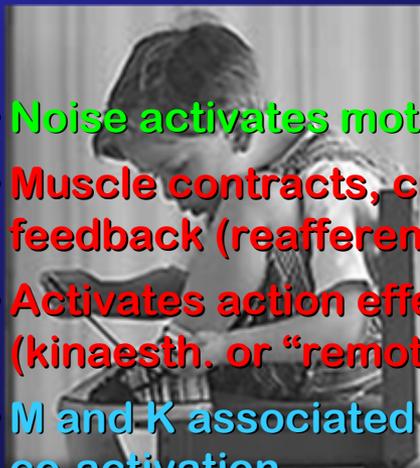

*...every representation of a movement awakens in some degree the actual movement which is its object.. (James, 1890)*

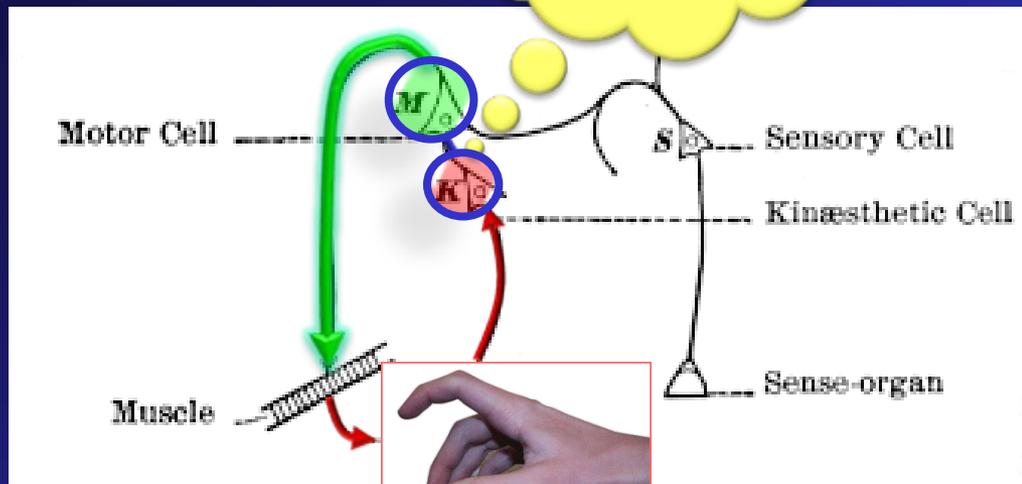

Lotze

James

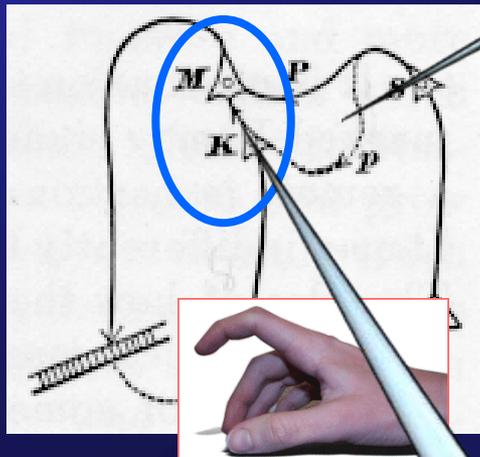

- **Noise activates motor pattern M**
- **Muscle contracts, creates sensory feedback (reafference)**
- **Activates action effect code K (kinaesth. or "remote")**
- **M and K associated through repeated co-activation**
- **"Imaging/anticipating" K (effect) can now trigger M → intentional action**

# Acquiring action effects (means-ends associations)

## Experimental rationale

- introduce novel action effect ( $R \rightarrow E$ )
- its code should become associated with movement ( $r \leftrightarrow e$ )
- activating effect code should prime motor pattern ( $e \rightarrow r$ )

Birgit Elsner

# Action-effect acquisition in adults

Acquisition Phase  
*(free choice)*

Transfer Phase  
*(forced choice)*

Stimuli

Responses

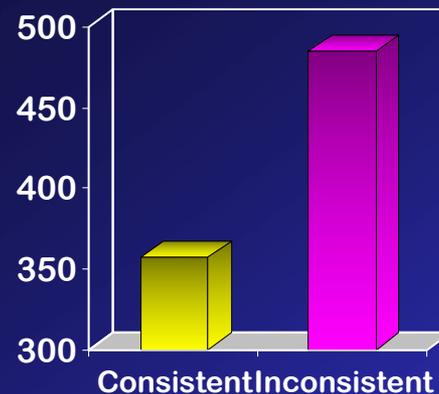

Effects

Better performance with **consistent** than **inconsistent** mapping?

Reaction Time

Indeed, transfer shows better performance with **consistent** than **inconsistent** mapping

# Action effects prime “free” choice

## Acquisition Phase (free choice)

## Transfer Phase (free choice)

Stimuli

Responses

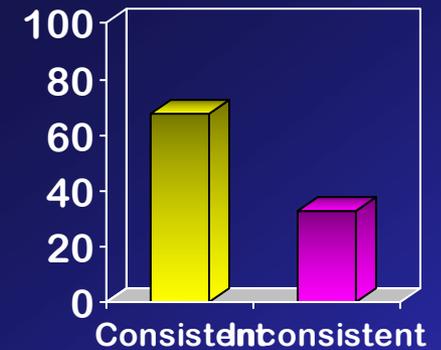

Effects

More stimulus-  
**consistent** than  
**inconsistent**  
response choices?

% Response  
Decisions

Free choice  
shows more  
**consistent** than  
**inconsistent**  
response  
choices

# Action-effect acquisition in children

## Acquisition Phase (free choice)

*Instruction:* respond when snitch is caught

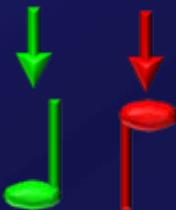

*Stimulus*

*Responses*

*Effects*

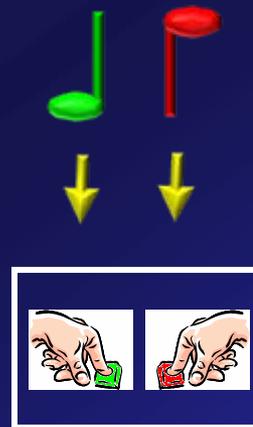

## Transfer Phase (forced choice)

*Instruction:* when magic hat talks:

or

consistent

inconsistent

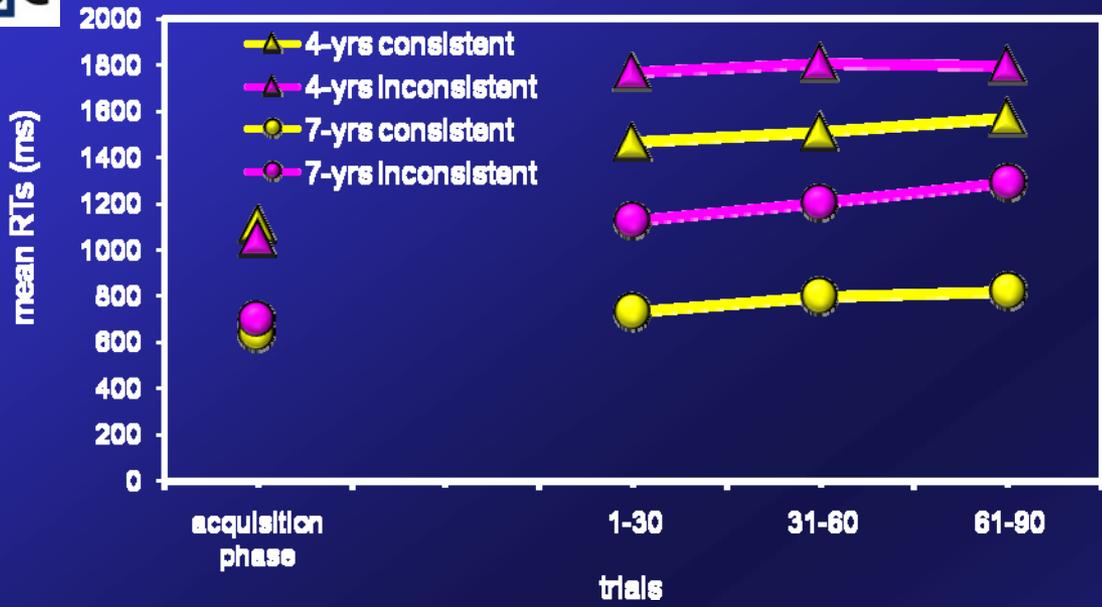

Rena Eenshuistra

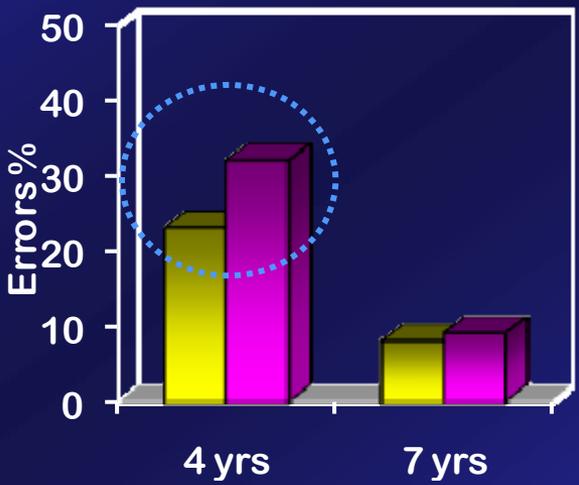

Maaïke Weidema

- Better performance with **consistent** than **inconsistent** mapping?

# Action-effect learning in (4-7y old) children

- Indeed, transfer yields better performance with **consistent** than **inconsistent** mapping
- Independent of age...?

- Larger consistency effect in 4-yr-olds
- due to “goal neglect” (→ frontal-lobe development)?

# Action-effect acquisition in infants

Stef Verschoor

## Acquisition

Baby watches  
(10 x)

Baby 'acts'  
(10 x)

## Test (3 trials, order balanced)

# Action-effect acquisition in infants

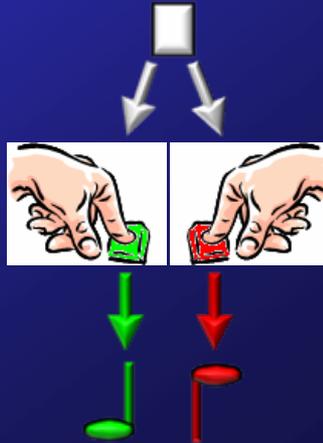

- No reliable transfer in 9-12 year-olds!?
- ≠ Rovee-Collier, Watson
- More difficult transfer (context)?
- Weak STM?

# Locating action effects in the human brain

Acquisition Phase  
(free choice)

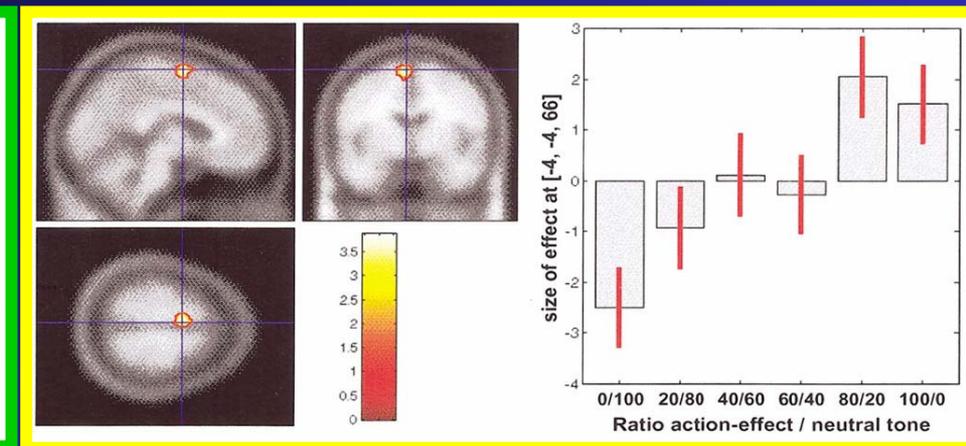

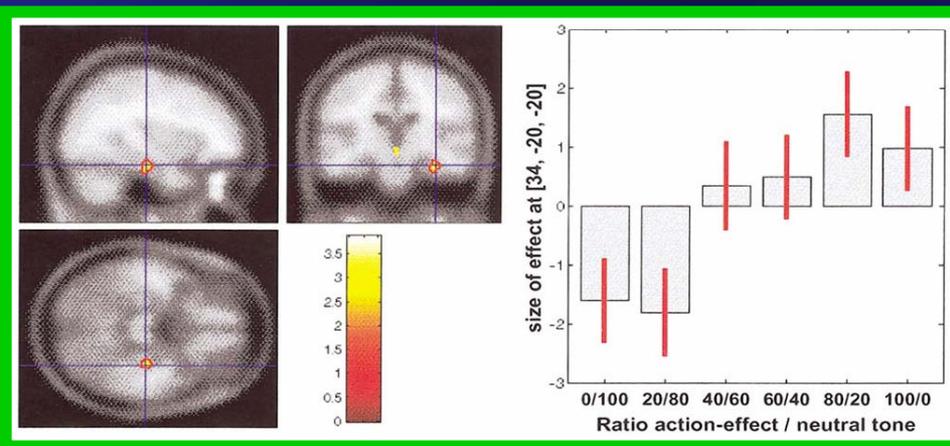

Transfer Phase  
(tone monitoring)

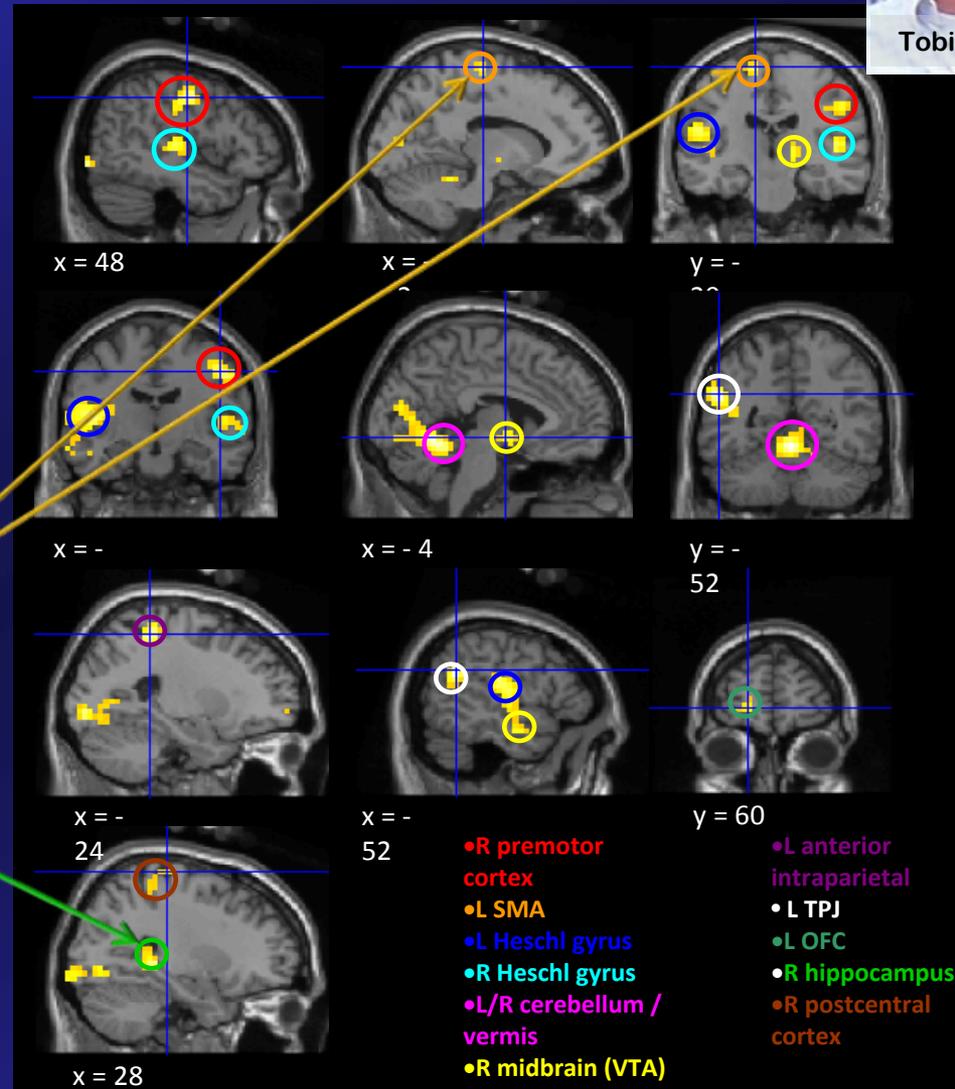

12 PET scans, parametric design: 0%, 20%, 40%, 60%, 80%, 100% effect tones

- **Rostral Supplementary Motor Area (SMA) proper: housing plans for voluntary actions**

- **Hippocampus: storing action-effect associations**

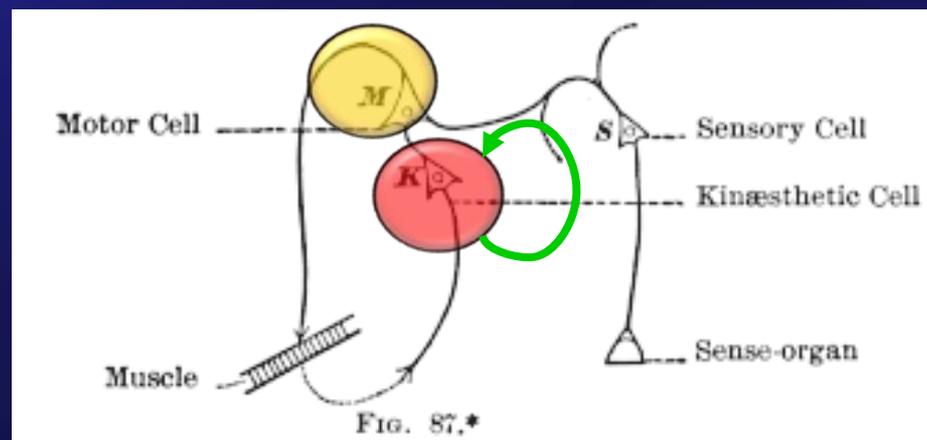

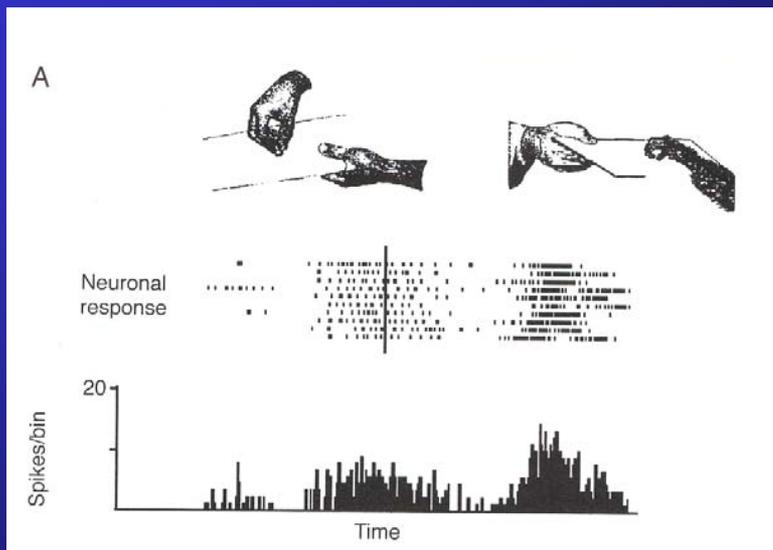

# Locating action effects in the human brain

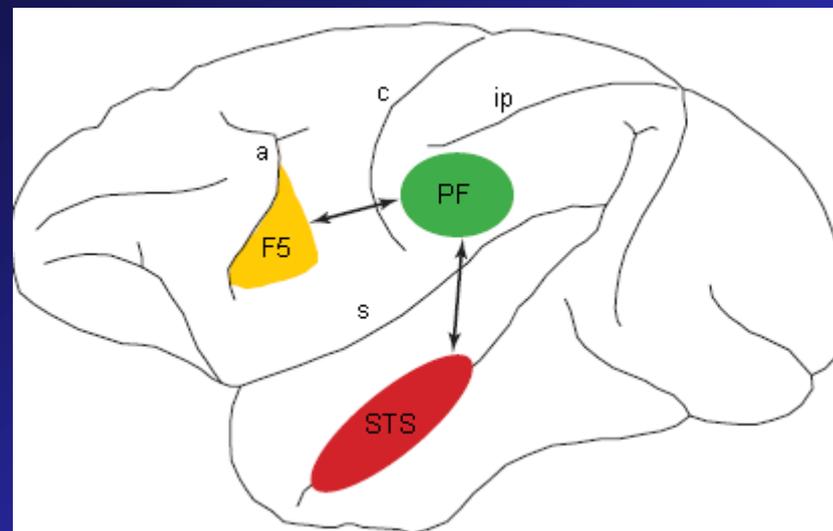

- **SMA: houses plans for voluntary actions**
- **Hippocampus: storing action-effect associations**

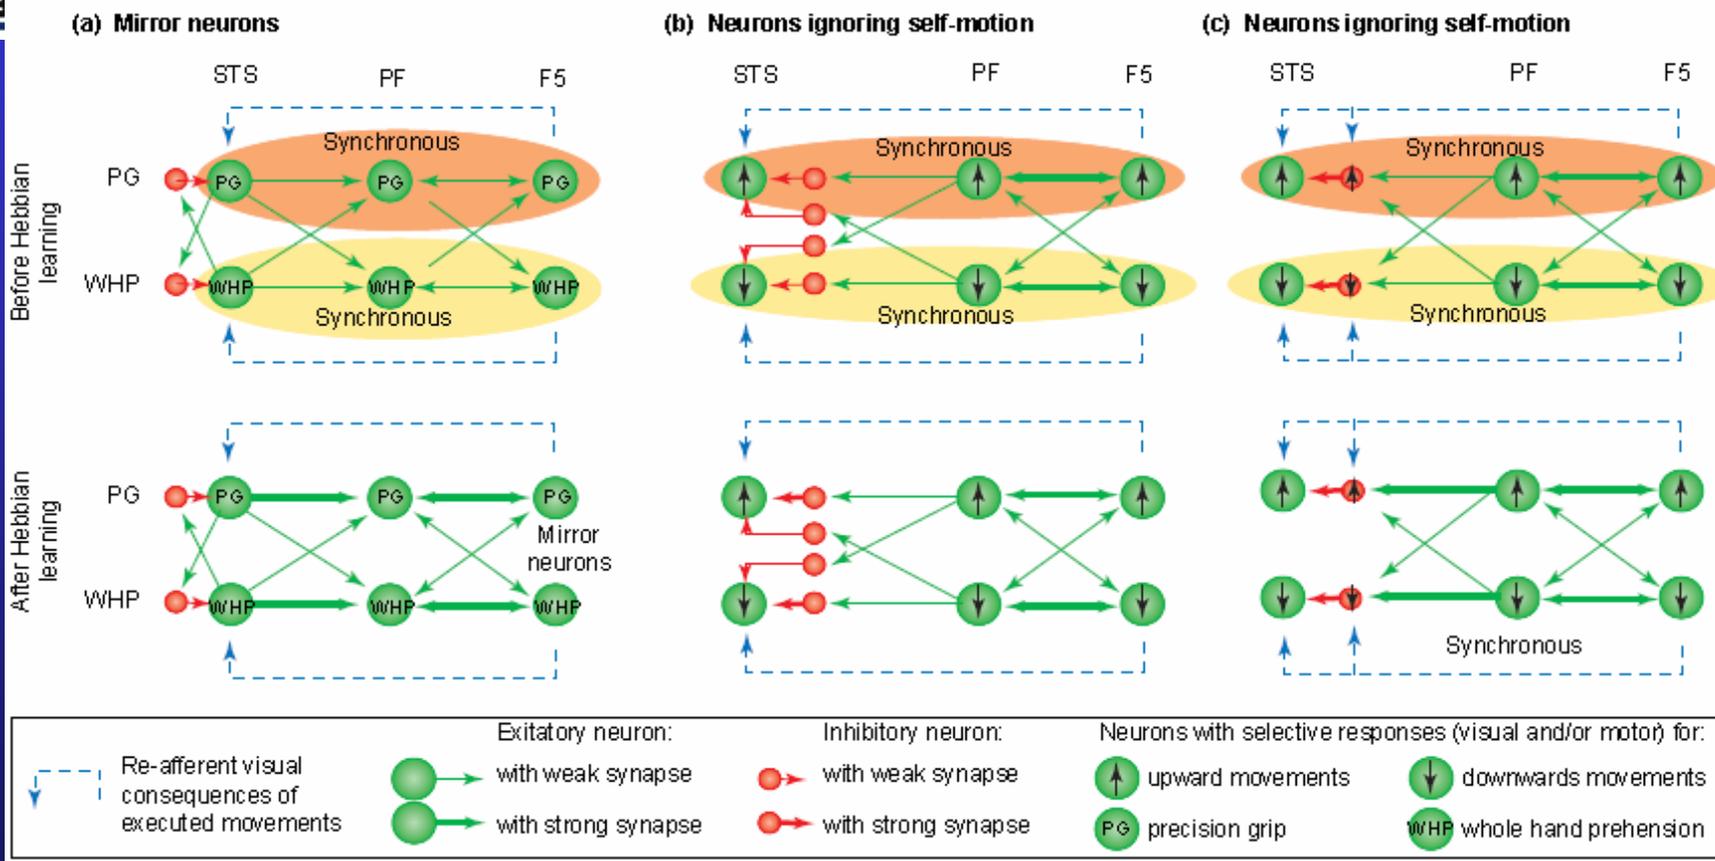

# Mirror neurons or mirror system?

**F5/SMA: action program**  
**PF (inferior parietal cortex):**  
 differentiating self from other  
**STS (superior temporal sulcus):**  
 integration of action effects

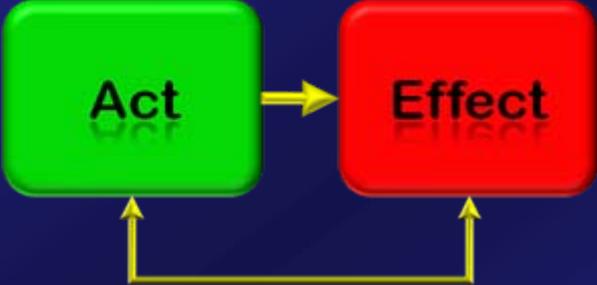

# Keyzers & Perrett (2004): Acquiring mirror neurons

- Perceiving oneself while acting associates action and effect
- Action-effect integration produces mirror neurons (James!)
  - Intermodal integration!

# Preconditions for action-effect acquisition

Acquisition as by-product of acting and exploration

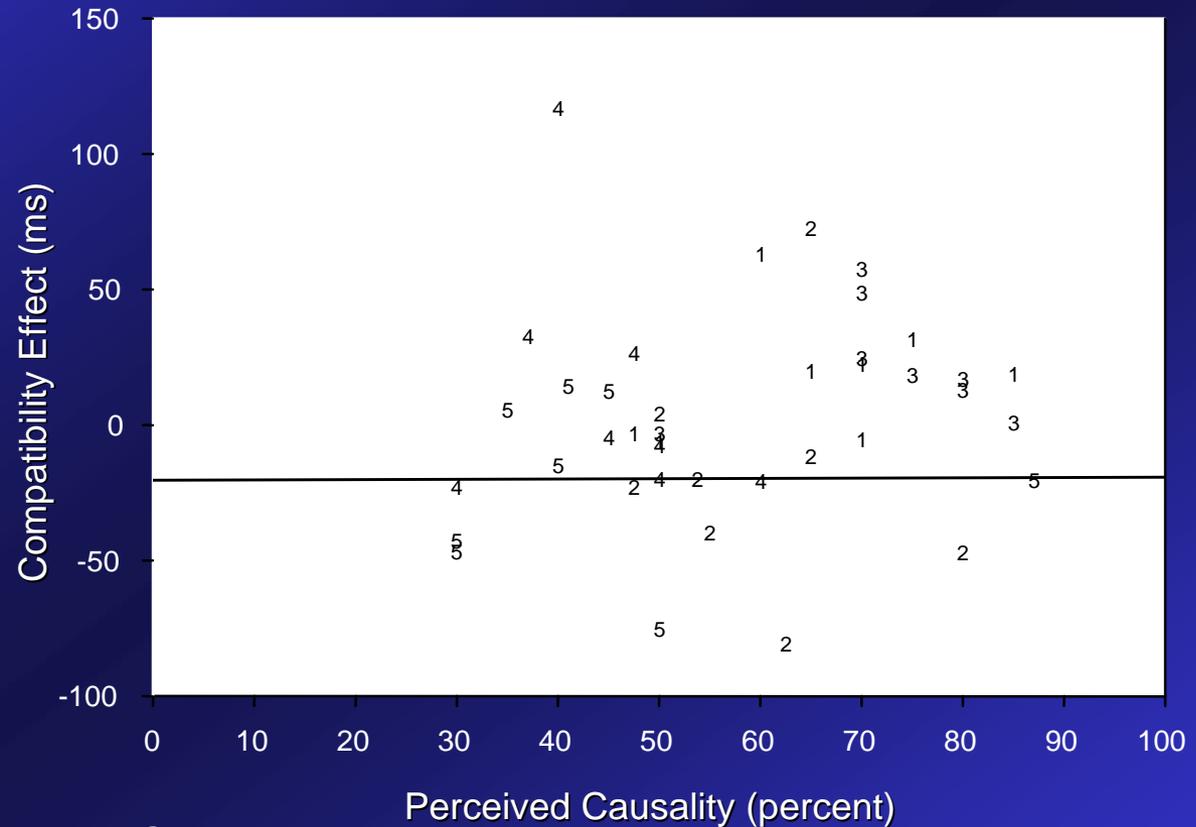

Acquisition as result of intentional search for means to an end

# AE learning does not depend on causal perception

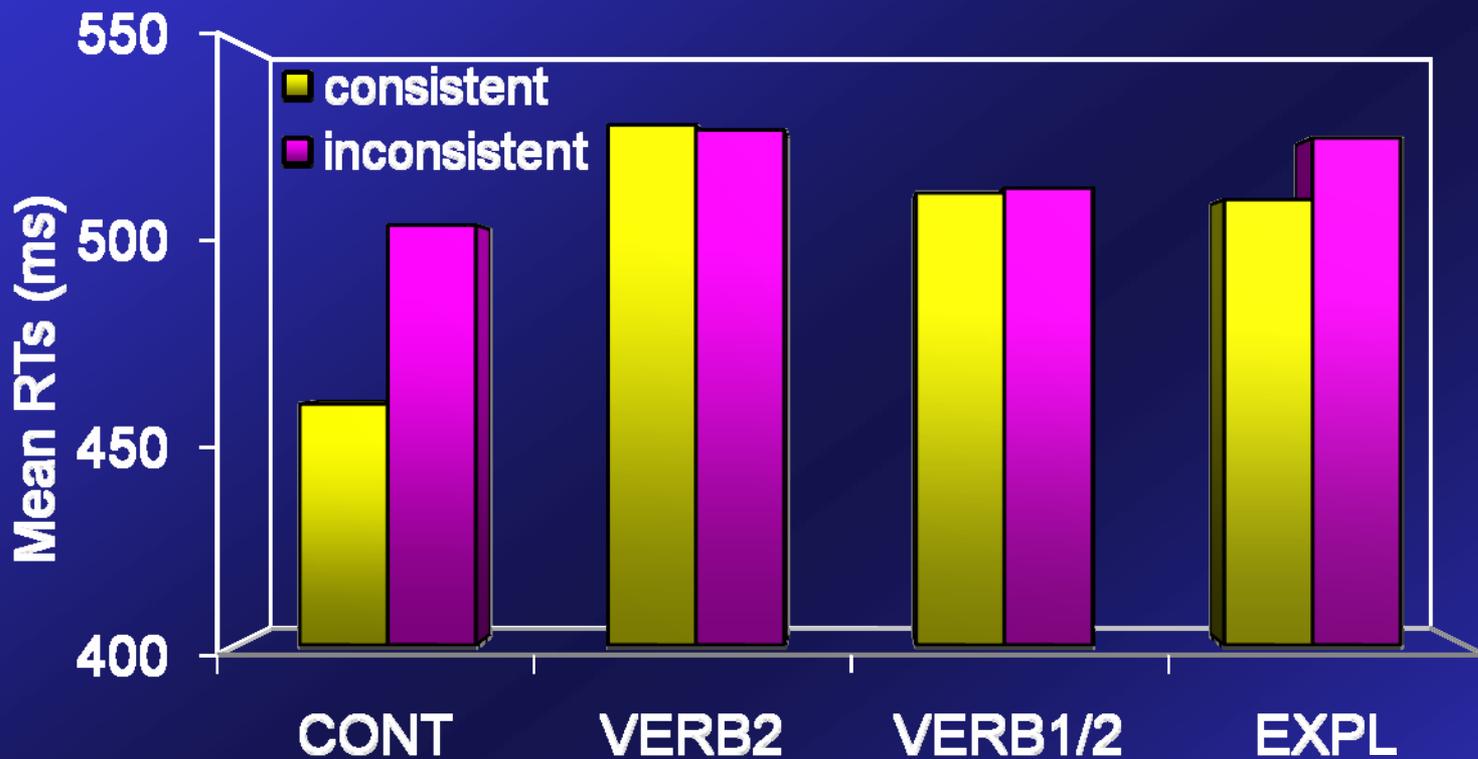

No correlation between learning and causal perception

Learning even in absence of insight into systematic relationship (Hommel, Alonso & Fuentes, 2003)

# AE learning prevented by conscious representation

Acquisition

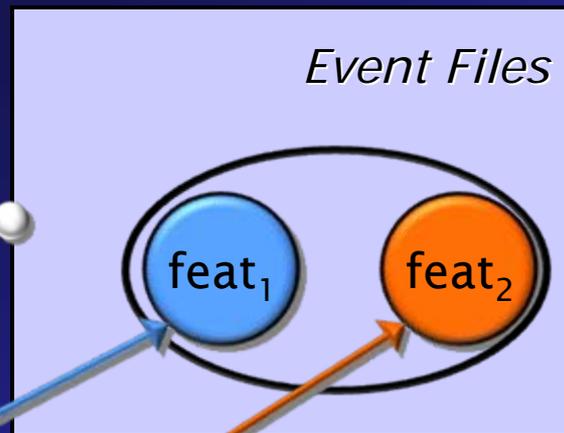

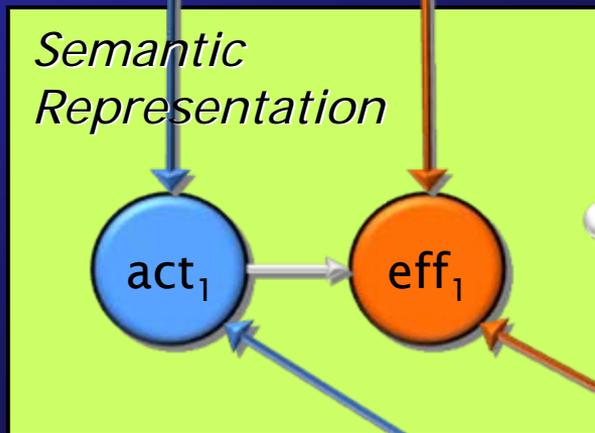

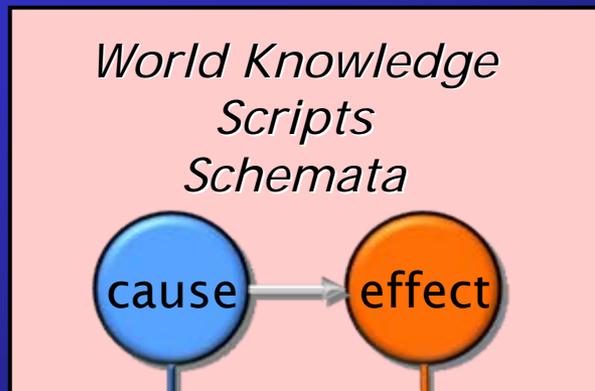

Test

# Dual integration model

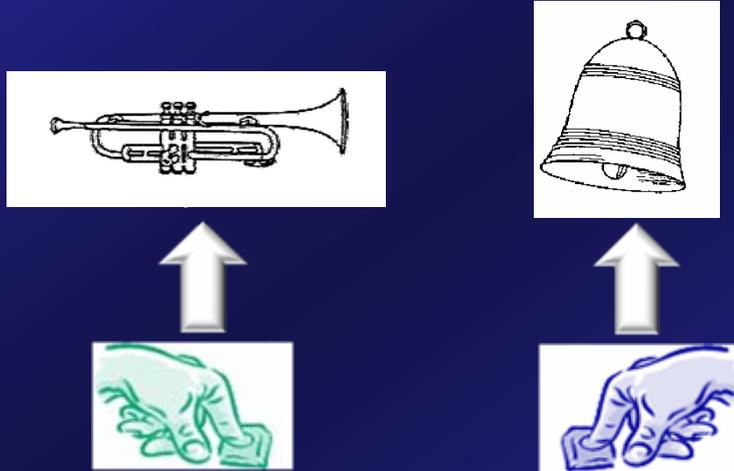

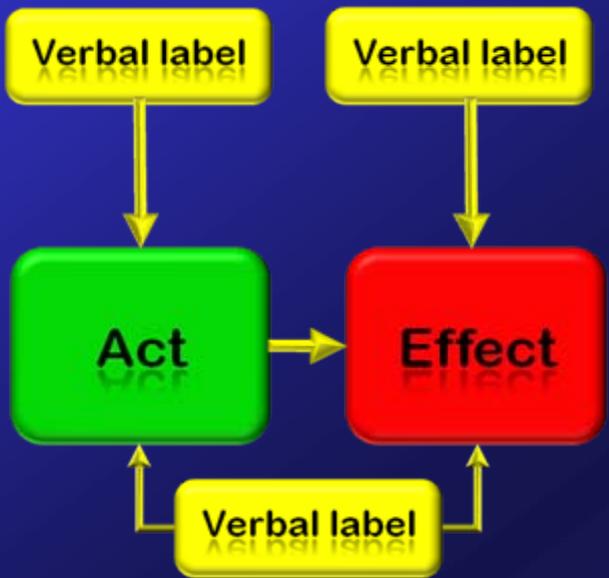

Interpretation

Association

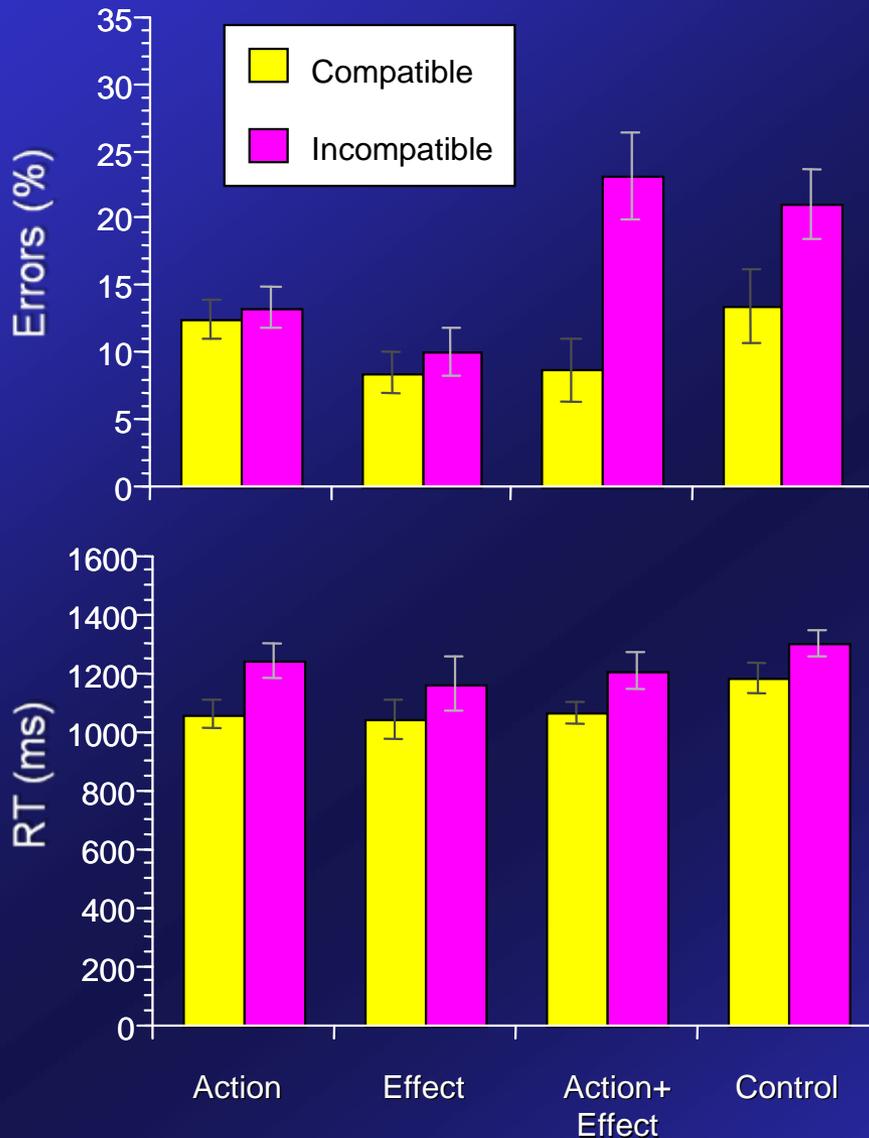

# Language as glue vs. pointer

## 4-year-olds in 4 groups

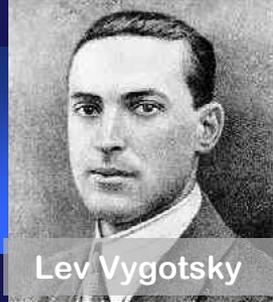

- Action: “green key”
- Effect: “trumpet sound”
- Action+Effect: “green key to produce trumpet sound”
- Irrelevant word

# Language as glue vs. pointer (4yrs)

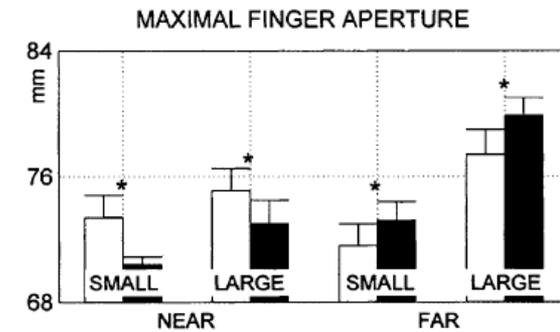

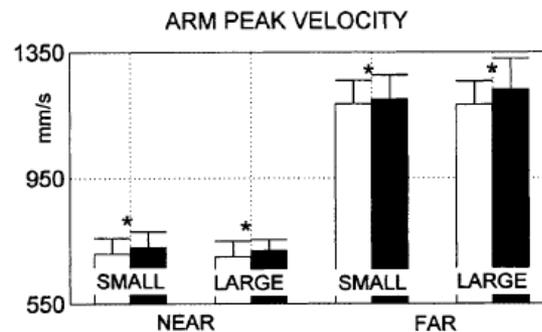

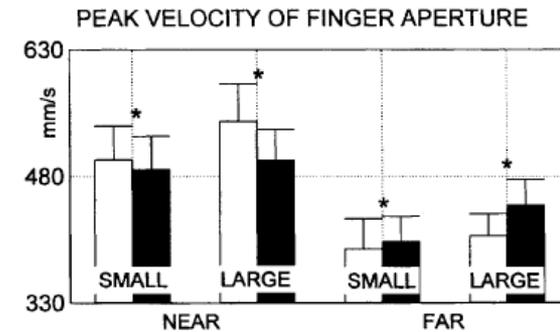

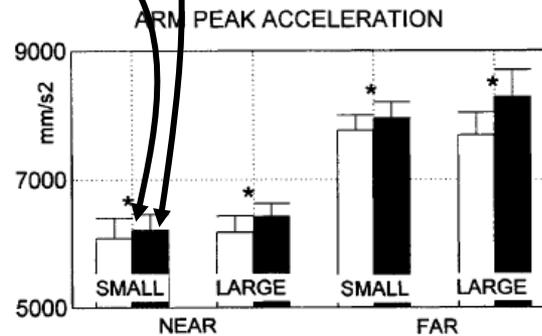

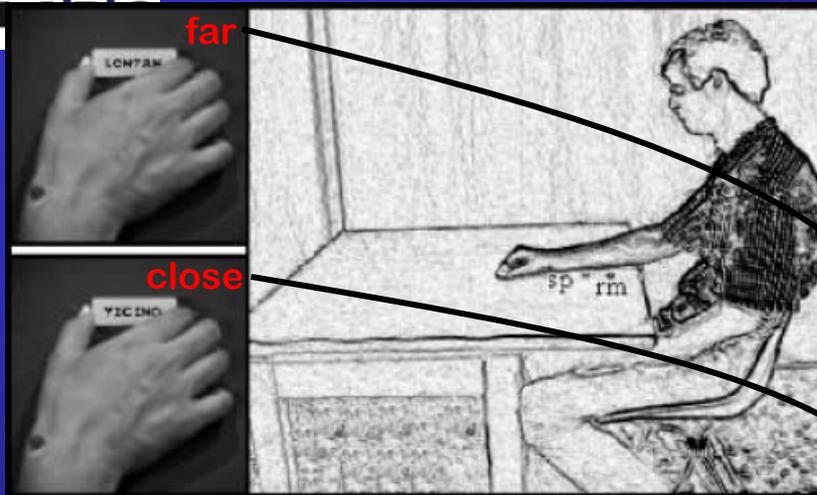

- No benefit from relational labels
- But interference from “single element” labels
- Labels as attentional pointers

# Vygotsky: Language and action control

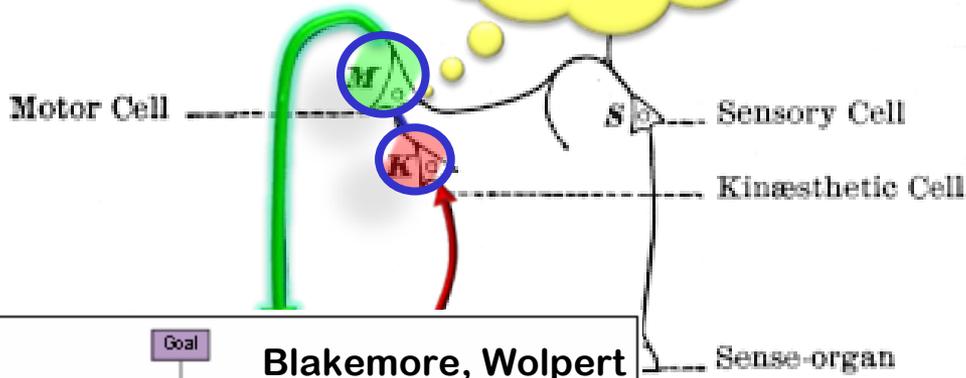

# Verbal labels as action retrieval cues

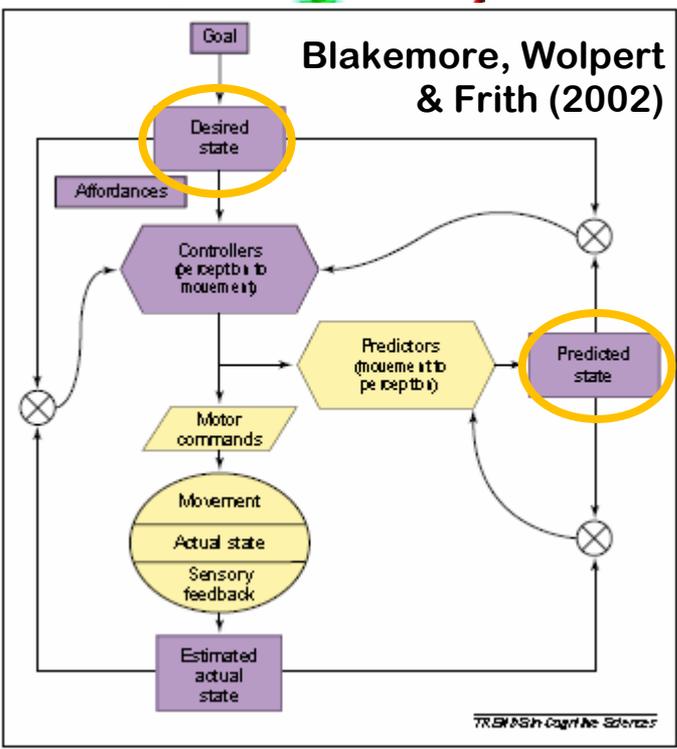

Gentilucci et al. (2000): Grasping objects with irrelevant labels

# AEs in selection and prediction/evaluation

**Blakemore, Wolpert & Frith (2002)**

**Schmidt (1975)**

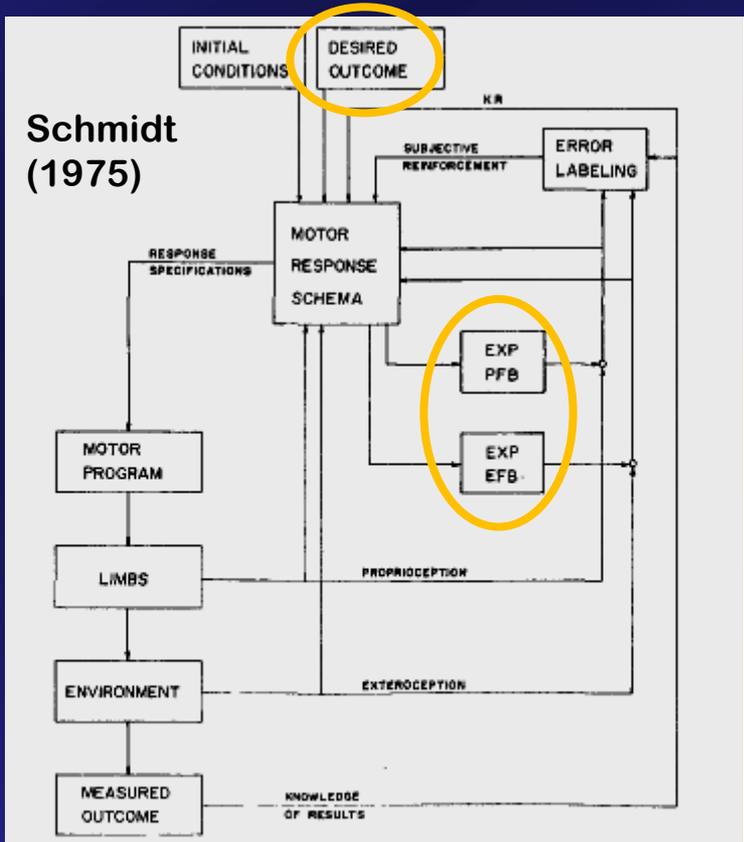

FIGURE 3. The motor response schema in relation to events occurring within a trial (recall and recognition schemata are combined for clarity). Abbreviations: KR = knowledge of results; EXP PFB = expected proprioceptive feedback; EXP EFB = expected exteroceptive feedback.

# Automatic monitoring of action effects

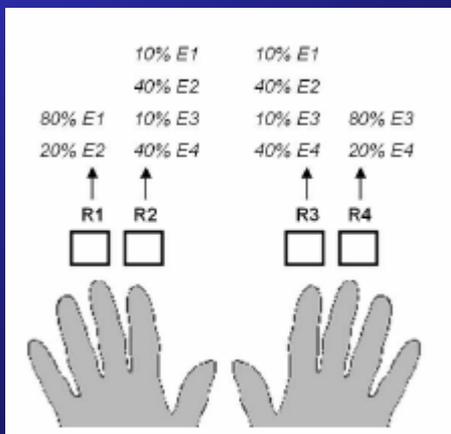

Imperative  
Stimulus

Response

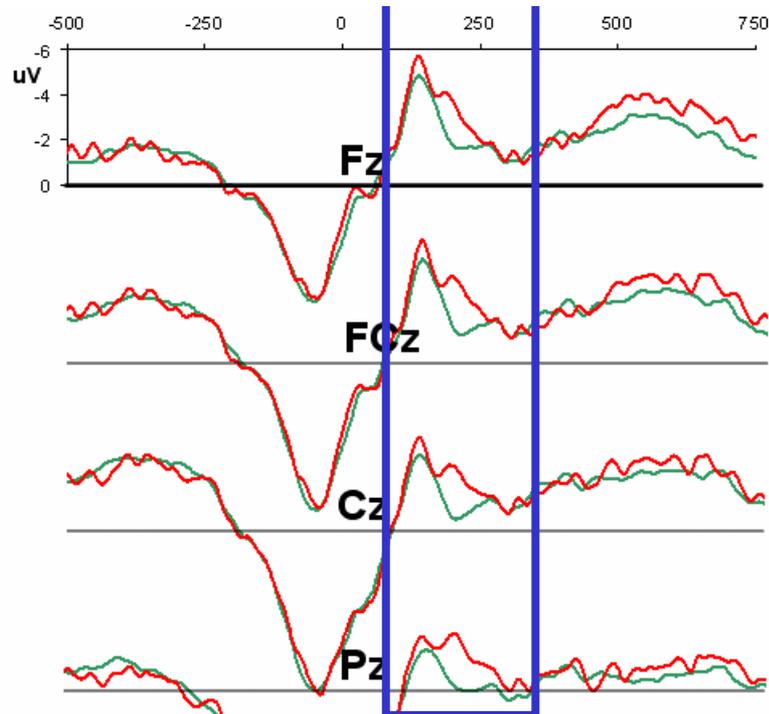

Action Effect:  
80%: /e/  
20%: /æ/

Deviant action effects evoke feedback-ERN-type negativity, but smaller and shorter in duration

## Deviant vs. regular action effect

N=19

Accuracy = .915

Mean RT = 406 ms

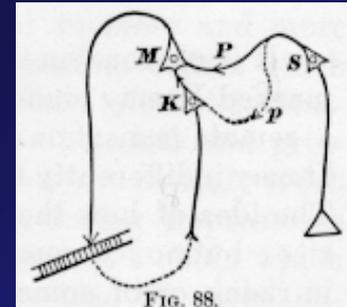

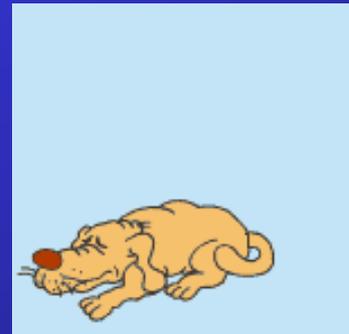

[150-250]

F(1,18)=7

p=.02

# Summing Up

- Novel, action-contingent events are registered and automatically associated with the accompanying action (hippocampus)
  - From early on (>1 yr)
- Action-effect codes mediate selection of intended action (SMA)
  - Depending on developing frontal cortex
- Language acts as pointer/action-retrieval cue
- Strong support for the idea underlying ideomotor theory: we select and evaluate our actions by anticipating their perceivable consequences!
